

Remote Management of Windows using Samba

Jelmer Vernooij
Samba Team

1 May 2006

Who am I?

- CS Student at the University of Utrecht (Netherlands)
- Part-time .NET and embedded systems developer
- Samba developer. I work mostly on Samba 4 these days, in this area:
 - pidl, the IDL Compiler and DCE/RPC
 - DCOM implementation and research
 - Registry implementation
 - Build system (building shared libraries)

Remote management from Windows

- Single-purpose tools: regedit, usrmgr, eventlog, etc..
- All in one: MMC
- Scriptable: VBScript
- Protocols involved
 - RAP
 - DCE/RPC
 - WMI / DCOM
 - LDAP

DCE/RPC introduction

- Used for IPC in Windows since NT
- Works over several protocols, most commonly:
 - “ncalrpc” (local)
 - TCP/IP
 - SMB (`\HOST\IPC$`)
 - IPX
- Different authentication mechanisms
- Full implementations in Samba 3 and Samba 4

IDL files

Samba 4 uses “Interface Definition Language” files and autogenerates parsers from them

```
[ uuid("894de0c0-0d55-11d3-a322-00c04fa321a1"), version(1.0),
  endpoint("ncacn_np:[\\pipe\\InitShutdown]"),
  pointer_default(unique)
] interface initshutdown {
  typedef [public] struct {
    [value(strlen_m(r->name->name)*2)] uint16 name_len;
    [value(strlen_m_term(r->name->name)*2)] uint16 name_size;
    initshutdown_String_sub *name;
  } initshutdown_String;
  WERROR initshutdown_Init(
    [in,unique] uint16 *hostname,
    [in,unique] initshutdown_String *message,
    [in] uint32 timeout,
    [in] uint8 force_apps,
    [in] uint8 reboot );
}
```

Interesting RPC interfaces

- winreg: remote registry editing
- initshutdown: reboot, shutdown
- svcctl: start/stop/list services
- atsvc: cron / at
- srvsvc: shares
- samr: user management
- eventlog: system events log

Interesting, but unimplemented

- wkssvc: start a join remotely, get client version, change name
- ntsvcs (Plugin and play): enumerate devices, detect devices, disable devices
- dnsserver / winstation: remote management of servers
- efs: encrypted file system support
- file system replication

Easy access using Samba4

- RPC interfaces are exposed as shared libraries
 - already used by one project (OpenChange)
- GTK+ frontends already exist for some interfaces
- Python bindings for some interfaces
- Server-side is implemented for some interfaces as well
 - Transparent management of Windows and Samba workstations

DCOM / WMI

- DCOM
 - Distributed Component Object Model
 - built on top of DCE/RPC
 - available since NT4
- WMI
 - implementation of WBEM
 - built on top of DCOM

DCOM / WMI - (Dis)advantages

- Advantages
 - Once implemented, easier to extend
 - Allows interesting things, more options than RPC
- Several disadvantages:
 - Disabled by default in newer Windows versions
(considered a security threat)
 - Very complicated, a lot of work to implement
 - Superseded by .NET and others

Conclusion

- Comments? Questions?
- Which APIs would you like to see available?
- Slides up at <http://samba.org/~jelmer/>
